4 Buy-side vs. sell-side analysts' earnings forecasts

Let a represent the sell-side ("ask") forecast error and b represent the buy-side ("buy" or "bid") forecast error.

$$\mu_a \approx -0.05 \quad \mu_b \approx 0.85$$
 $\sigma_a \approx 0.85 \quad \sigma_b \approx 1.93$

$$z_x = \frac{x - \mu_X}{\sigma_X}.$$

a. The probability that a buy-side analyst has a positive forecast error of 2 or higher.

$$P(b \ge 2) = P(z \ge z_2).$$

$$z_2 \approx \frac{2 - 0.85}{1.93} \approx 0.596.$$

$$P(b \ge 2) \approx \Phi(0.596) \approx 0.276.$$

b. The probability that a sell-side analyst has a positive forecast error of 2 or higher.

$$P(a \ge 2) = P(z \ge z_2).$$

$$z_2 \approx \frac{2 + 0.05}{0.85} \approx 2.4.$$

$$P(a \ge 2) \approx \Phi(2.4) \approx 0.0079.$$

5 A Pepsi machine at a Burger King store

Let X represent the volume filled.

$$P(X > 8 \text{ oz}) = P(z > z_{(8 \text{ oz})}) = 0.01.$$

$$P(X \le 8 \text{ oz}) = P(Z \le z_{(8 \text{ oz})}) = 0.99.$$

$$z_{(8 \text{ oz})} = \text{probit}(0.99) \approx 2.3263...$$

$$z_x = \frac{X - \mu_X}{\sigma_X}.$$

 $\sigma_X = 0.2 \text{ oz.}$

$$z_{(8 \text{ oz})} = \frac{8 \text{ oz} - \mu_X}{0.2 \text{ oz}} \approx 2.3263...$$

 $\mu_X = X - z_x \sigma_X.$

$$\mu_X \approx 8 \text{ oz} - (0.2 \text{ oz})(2.3263...) \approx 7.5346...$$
